Project: DB Collaborator (Team Fraggle Rock)

Goal: Create a web application that allows managing a MongoDB database
while managing metainformation for seciurty and version control.

D0:

```
Database          Edits representation of      Web App          Makes queries via API      MongoDB
Manager           Database via text boxes                       to update database
                                                                 with user input and
                                                                 metainformation

                  Web App uses queries to fetch values and
                  present them on web app
```

D1:

```
                              Web App
                            (Front-End)

Key
Component          Provides/Returns

Login          Data Entry      Authentication      Produces XML for
Information                     Response            content generation

                              Web App              Data          MongoDB
                            (Back-End)                           Database

              Populate          Queries for
              Metainformation   Authentication/Data
                                Entry
```

D2:

```
Login Page          All Objects          Object Editor
                    Page                 Page

            Web App          XSLT             Web App
            produces         produces         gathers data
            XML              layout (html)    entry and
            representation                    produces
            database                          metainformation

                    Query API for
                    Java

                    MongoDB
                    database
```
